Redecting and treating prostate cancers

Novel human prostate specific tumour protein and fragments - useful protein and treating prostate cancers

Novel human prostate specific tumour specific gene, and can for detecting and treating prostate tumour specific gene, and can can be method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent cancer comprises contacting a biological sample with an agent canced by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, continuous progression of, or treat prostate cancers. The antibody may called the conjugated to a therapeutic agent for use in therapy of prostate
Sj23-like protein
Secreted protein B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 GTGGAGCCTCAGCAGTTCCCTCTTTCAGAACTCACTGCCAAGAGCCCTGAACAGGAGCCA 120

used in a vaccine for the treatment of prostate cancer claim 3: Page 80: 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene can be used to generate from a cetailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion ce.g. V34167) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 70 novel genes and their fragments (nucleic acid sequences: V34154-V3426; amino acid sequences W7507-W75179) which sequences: V34164-V3426; amino acid sequences W7507-W75179) which sequences to protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in (see V34154 for described

Glaim, i. Page 66-67; Il4pp; English.

This cDNA clone, designated AT415_4, codes for a novel human secreted protein (see W58380). It was isolated from a human adult retina CDNA library using methods selective for cDNAs that encode secreted proteins. The clone is deposited in composite clone retina cDNA inbrary using methods selective for cDNAs that encode secreted proteins. The clone is deposited in composite clone from the composite. The predicted AT415_4 amino acid sequence shows homology to human M3252 and CO-099 tumnour associated antiques. Novel cDNA clones (see W30916-32) coding for human secreted proteins (see W58580-90) are claimed. These can be used antiques. Novel cDNA clones (see W30916-32) coding for analysis, characterisation, diagnostic or therapeutic use. They can also be used as tissue or mol.wt. markers, for chromosome identification, used as tissue or mol.wt. markers, for chromosome identification, interaction trap assays. The secreted proteins may also have many biological activities, e.g. cytokine, immunomodulator, ity, activity, hammatory, capherin and tumour invasion suppressor activity, hammatory, and thrombolytic activity, receptor/ligand activity, and tumour inhibition activity, repertories can be expressed in vivo from DNA, introduced in gene therapy vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300

```
New isolated human genes and the secreted polypeptides they encode disordated human genes and treatment of e.g. cancers, neurological disordars, immune diseases, inflammation or blood disorders detailed in the descriptor line. The gene can be used to generate fusion protein by linking to the gene to a human immunoglobulin Fc portion cetegorers disorders 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GTGGAGCCTCAGCAGTTCCCTCTTTCAGAACTCACTGCCAAGAGCCCTGAACAGGAGCCA 120

Clone HPWAE25 is a member of the TM4SF receptor superfamily. The products generated using the receptor can be used for treating abnormal conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, Graves disease or immunocompromised disease states. The products can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

Figure 1 the second and screening for antagonists useful for stimulating cell proliferation and screening for antagonists useful to treat or proliferation and screening for antagonists useful to treat or prevent cell proliferation disorders e.g. cancers

Disclosure; Fig 1A-1C: 54pp; English.

This is the nucleotide sequence of the human tumour-associated antigen (PRT) used in the method of the invention for stimulating cell proliferation and screening for antagonists useful to treat or prevent cell proliferation disorders such as cancer, and genetic defect e.g. sickle cell anaemia. The polypeptides can be combined with a suitable carrier in pharmaceutical compositions, and also used to screen for antagonists, agonists, and to generate antibodies. PRAT agonists can be added to a cell to stimulate cell proliferation by increasing or prolonging the activity of PRAT as above. The antagonists can be added to a cell to stimulate cell proliferation by increasing or prolonging the activity of PRAT as above. The antagonists can be administered to subjects to treat or prevent disorders associated with cell proliferation, especially cancers. Antibodies specific for PRAT may be used directly as antagonists, or indirectly as a trageting or delivery mechanism to bring pharmaceutical agents to PRAT-expressing cells. They are also useful to diagnose conditions or interventions. The polynucleotide encoding PRAT, or complementary sequences, can be used to produce hybridisation probes, useful to diseases relating to polypeptide expression or monitor PRAT regulation curing therapeutic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer claim 3; Page 41; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

NOVEL human prostate specific tumour protein and fragments - useful por detecting and treating prostate cancers.

Tor detecting and treating prostate cancers.

Claim 1; Page 42; 141pp; English.

This sequence represents a human prostate tumour specific gene, and can assequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may be conjugated to a therapeutic agent for use in therapy of prostate cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      649
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Movel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers
claim 1: Page 42: 141pp; English.
This sequence represents a human prostate tumour specific gene, and c be used in the method of the invention. The method is for detecting prostate cancer comparises contacting a biological sample with an agen able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prosti
                                                                                                                                                                                                                                                                                                                                                         300

                                                                                                                                                                                                                    The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

for detecting and treating prostate cancers
Claim 1: Page 40: 141pp; English.
This sequence represents a human prostate tumour specific gene, and can
be used in the method of the invention. The method is for detecting
prostate cancer comprises contacting a biological sample with an agent
able to bind an immunogenic portion of a prostate protein (such as
encoded by this sequence). An antibody which binds to an immunogenic
portion of the prostate protein, and the method can be used to detect,
monitor progression of, or treat prostate cancers. The antibody may
also be conjugated to a therapeutic agent for use in therapy of prostate

Claim 3. Page 40; 130pp. English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

Claim 3; Page 39; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library. 188 A; 196 C; 167 G; 156 T;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 8, Apsociation Sequence 41, Sequence 41,
